DOG DETAILS

Sample ID:	AA640157	Owner:	Jannes van Ravenhorst
Call Name:	Juno	Microchip:	528140000817236
Official Name:	Juno Lucina from Bri-Jos Home	Stud Book Number:	NHSB.3224622
Breed:	Leonberger	Sample Material:	Buccal Swab
Sex:	Female		
Date of birth:	14.02.2021		

Sample collection performed by: **Veterinary**

De Groene Grens Dierenartsen: Lunteren, Woudenberg

DLA-DRB1	00601	01601
DLA-DQA1	00101	00101
DLA-DQB1	00201	00201

Interpretation: Match in 2 out of 3

Genetic analysis of the three DLA genes, DLA-DRB1, DLA-DQA1, and DLA-DQB1, showed that the examined dog has two largely identical gene combinations (haplotypes), with matches in 2 out of the 3 tested genes. This indicates that the dog is primarily homozygous and has a restricted genetic diversity in the analyzed DLA genes. Usually, these genes are passed on together as a group of three to the next generation. The genetic testing was done based on the latest scientific knowledge.

Breeding Relevance

The tested dog has two nearly identical sets (haplotypes) of DLA combinations. Before breeding, it is important to compare these combinations with the partner's haplotypes. By figuring out the genes of both parents, it is possible to predict what gene combinations are possible in the puppies. To preserve genetic diversity, ensure that mating doesn't result in homozygous puppies with the same haplotype 1 and 2, considering all relevant breeding factors.

Important

If a dog has two identical gene combinations (homozygosity) in its DLA genes, it shouldn't automatically be excluded from breeding. Pairing two homozygous breeding partners in the DLA genes can actually be beneficial for the puppies, as long as both parents don't have the same homozygous gene combinations. In that case, all the puppies would inherit diverse DLA genes.

Following you will find risk haplotypes or protective haplotypes which are known in your dog's breed and which are associated with specific diseases. Matches with these haplotypes may result in an increased risk/protection against diseases. However, this does not necessarily mean that your dog will develop a disease if it carries a risk haplotype. Onset of autoimmune diseases depends on multiple factors and not only on genetic predisposition.

Risk Variants

Name	DLA-DRB1	DLA-DQA1	DLA-DQB1
Autoimmune lymphatic thyroiditis		00101	

Protective Variants

Currently no known protective variants.
